Approval Date: 11/01/2016

XLT warrants Version F ovens manufactured after January 1, 2016 to be free from any defect in material and workmanship under normal use for seven (7) years from the date of original purchase by the end user, and further warrants main fan blades, conveyor shafts, and conveyor bearings for ten (10) years. XLT further warrants all ovens to be free from rust for ten (10) years from the date the equipment is originally purchased. XLT warrants Version E hoods manufactured after December 1, 2015 to be free from any defect in material and workmanship under normal use for five (5) years from the date of original purchase by the end user purchaser. In the event of a part failure, XLT will furnish a replacement part and pay for all labor associated with the replacement of the part. If upon inspection XLT determines that the part is not defective, all incurred cost will be the responsibility of the end user purchaser. This warranty is extended to the original end user purchaser and is not transferable without prior written consent of XLT. Damages are limited to the original purchase price.

DUTIES OF THE OWNER:

- The owner must inspect the equipment and crates at time of receipt. Damage during shipment is to be immediately reported to the carrier and also to XLT
- The equipment must be installed and operated in accordance with the written instructions furnished with the unit
- This warranty shall not excuse the owner from properly maintaining the equipment in accordance with the written instructions furnished with the unit
- A copy of the "Initial Start-Up Checklist" must be filled out and returned to XLT when the unit is initially installed, and/or when the unit is removed and installed in another location
- The gas, electric, and HVAC utilities must be connected to the oven and installed by locally licensed contractors
- Failure to contact XLT Ovens prior to contacting a repair company for warranty work voids any and all warranties

WHAT IS NOT COVERED:

- Freight damage
- Overtime charges
- Any part that becomes defective because of utility services (power surges, high or low voltages, high or low gas pressure or volume, contaminated fuel, or improper utility connections)
- Any part that becomes defective because of moisture and/or other contaminants
- Conveyor belts
- Filters
- Exhaust Fans
- Light Bulbs

NOTIFY CARRIER OF DAMAGE AT ONCE

Upon receiving of all goods shipped by a Common Carrier, check for any exterior damage that may indicate interior damage. If conditions permit, open all crates & do a full inspection for any damage while the delivery driver is still there. If there is damage, please note on the delivery receipt & call the carrier to make a freight damage claim within 24 hours of receipt. Failure to make a damage claim within the first 24 hours may void the opportunity to have the claim resolved.

XLT Ovens wants you to be totally satisfied with every aspect of owning & using your oven & hood. Your feedback, both positive & negative, is very important to us as it helps us understand how to improve our products & our company. Our goal is to provide you with equipment that we are proud to build & you will be proud to own.

To receive technical support for the oven or hood you purchased, XLT has qualified customer service personnel that can provide assistance on any type of XLT oven problem you may experience. Customer Service is available 24/7/365 or visit www.xltovens.com.

This manual covers the following XLT Oven & AVI Hood models:

Ovens	Hoods
X3F3-1832-xxxxx	H3E-1832-xxxxx
X3F3-2440-xxxxx	H3E-2440-xxxxx
X3F3-3240-xxxxx	H3E-3240-xxxxx
X3F3-3255-xxxxx	H3E-3255-xxxxx
X3F3-3855-xxxxx	H3E-3855-xxxxx

The first 2 digits of the model number after the dash represent the conveyor width and the last two digits indicate the bake chamber length. The five x's after those numbers represents the oven and hood configuration number. The ovens may be used in a single, double, or triple stack configuration. All models have a single control box, which can be mounted on either the right-hand or left-hand side, and are heated by electric elements. All models can be configured for a split belt conveyor.

OVEN DESCRIPTION

Food product is placed on the stainless steel wire conveyor belt on one side of the oven. The conveyor then transports the food through the bake chamber at a user-controlled speed. This provides repeatable and uniform food cooking. The conveyors can be easily configured to move either left-to-right or right-to-left with a simple programming change. A large center sandwich door allows the introduction or removal of food items for cooking at shorter times. Precise temperatures are user adjustable and maintained by a digital control.

An easily removable front panel allows the full cleaning of the oven interior. All exposed oven surfaces both exterior and interior are stainless steel. The conveyor is a one piece design and is removed from the side which has the control box. No tools are required for disassembly and cleaning of the conveyor or oven interior. The oven itself is mounted on lockable swivel casters for easy moving and maintenance.

Accessories such as extended conveyor shelves, base shelves, extended fronts, fire suppression components, and perforated crumb trays are available from XLT. In addition, moving equipment such as carts and lifting jacks are available to help install and move ovens. Please contact XLT Ovens or your Authorized Distributor for more information.

4 Wire Service - L1, L2, L3 +1 Ground (per oven)				5 Wire Service - L1, L2, L3 N +2 Grounds (per oven)				

FOR EACH OVEN:

- A separate circuit breaker must be provided for each oven deck.
- Electrical connections must be accessible when the ovens are in the installed position.
- Electrical connections must meet all local code requirements.
- Ensure ovens are grounded per local codes.

These ovens are suitable for installation on either combustible or non-combustible floors, and adjacent to either combustible or non-combustible walls. The motor cover is designed to provide the proper clearance to the back of the oven. The minimum side clearances are 6in. / 150mm, measured from the end of the conveyor.

NOTE Utilities must be easily accessible when the ovens are in the installed position. Do not install utilities behind the ovens.

All installations must conform to local building and mechanical codes. It is required that the ovens be placed under a ventilation hood to provide exhaust ventilation and adequate air supply.

Base Assembly - Single & Double Stack

Base Assembly - Triple Stack

WARNING & SAFETY INFORMATION

XLT ovens can easily be moved and stacked with the proper lifting equipment. The use of XLT approved lifting equipment is highly recommended. Contact XLT for more information.

**DANGER**

- These ovens are heavy & can tip or fall causing bodily injury.
- NEVER place any part of your body beneath any oven that is suspended by the lifting jacks. A crush hazard exists if the oven falls or slips.
- DO NOT place your hands on the lifting jack vertical pole beneath the jack's winch. As the jack's winch descends when you turn the jack handle, a pinch point is created between the winch & the pole.

**CAUTION**

BE CAREFUL when rolling the oven on the cart, especially when going up or down ramps & over bumps. Leave the straps/banding on until the oven is near the assembly area.

**DANGER**

- Make sure that the notch on tube of the winch assembly is aligned with the pin in the tripod base as shown. These alignments are important and keep the jack aligned properly.
- Check for smooth operation. The cable should not be pinched and should pass smoothly over the pulley on top of the pole assembly.
- Inspect cable prior to each use.
- If cable is frayed or shows signs of excessive wear and tear, DO NOT USE until cable is replaced.
- At a minimum replace the cable annually with wire rope that meets or exceeds the jack manufacturer's specifications.
- Do not exceed the stated capacity of the jack.

NOTE → The Lifting Pipe hole, marked for the appropriate oven size, must be installed closest to the control box.

Stacking the Ovens

**DANGER**

Failure to engage the Lifting Jacks into the Lifting Pipe properly and completely will result in damage, injury, or death from a falling oven.

**DANGER**

- Both jacks should be raised in unison, otherwise they may bind and a dangerous situation will develop.
- Do not put any part of yourself under the oven at any time.
- The Oven is top heavy. Be careful.

Stacking the Ovens

Removing Finger Clips

 Finger clips for transportation purposes only. Discard once removed.

Physical Location & Spacing Requirements

These ovens are suitable for installation on either combustible or non-combustible floors, and adjacent to either combustible or non-combustible walls. The motor cover is designed to provide the proper clearance to the back of the oven. The minimum side clearances are 6in. / 150mm, measured from the end of the conveyor.

 **All installations must conform to local building and mechanical codes.**

NOTE

Restraint

Because all ovens are equipped with casters, all installations must be configured with a restraint to limit the movement of the oven without depending on the electric power supply cord to limit the oven movement. One (1) restraint kit, which includes one (1) eye bolt, (1) stainless steel clip & a cable, is required for each oven stack, regardless if used on a single, double, or triple configuration. The clip should be installed in the lowest hole of the back wall on the control end of the lowest oven in the stack. The lag eye bolt must be installed into a structural member of a wall or the floor. It is the owner's responsibility to ensure the restraint is installed correctly.

Upon completion of performing any service or cleaning functions that require removal of the restraint, insure that it is correctly re-attached to the oven.

The requirement for fire suppression systems vary by location and the authority having jurisdiction. If you are required to install fire suppression on your oven, a pre-assembled piping kit is available that utilizes pre-existing holes that simplify installation and future service.

This design has been tested and approved to successfully comply with fire suppression codes. It uses only two (2) nozzles per bake chamber, and allows crumb trays, chain guards, and all other accessories to be easily removed. The kit does not interfere with any operations or maintenance.

For detailed information regarding fire suppression, see manual XD-9011 Fire Suppression Installation for AVI Hoods and XLT Ovens.

Ventilation Requirements

A powered ventilation hood is required to remove heat and vapors. Some provision must be made to replenish the amount of air that is extracted from the building. The hood and HVAC installation must meet local building and mechanical codes. Requirements vary throughout the country depending upon location. Proper ventilation is the oven owner's responsibility. The AVI Hood system is designed to meet all requirements for XLT ovens and it is our recommendation that this system be used.

Ventilation Guidelines

Obtain information from the authority having jurisdiction to determine the requirements for your installation. Your ventilation hood supplier and HVAC contractor should be contacted to provide guidance. An air balance test is highly recommended, performed by a licensed contractor. A properly engineered and installed ventilation hood and HVAC system will expedite approval, reduce all maintenance costs, and provide a more comfortable working environment. XLT also recommends that the operator switches for the ovens and the operator switch for the exhaust fan be interlocked so that the exhaust fan gets energized whenever the ovens are turned on. Ventilation Performance Test

After the oven and ventilation hood have been installed and are operating, a smoke candle can be used to “see” if the heat and vapors are being completely extracted. The test procedure is outlined below:

- The oven must be operating at 450°-500°F / 232°-260°C.
- The conveyor must be turned off.
- The ventilation hood exhaust fan must be turned on.
- Put a smoke candle in a pan on the conveyor belt at the center of the oven.
- Observe the smoke pattern coming out of the oven.
- Repeat the smoke candle test for each oven, as well as when all ovens are operating.

The ventilation hood must capture all of the smoke from the oven.

After the exhaust fan has been adjusted to completely capture and contain the heat, there needs to be a corresponding amount of make up air (MUA) introduced into the building to offset the amount of air volume being removed. An air balance test can determine the proper amount of make-up air flow rates.

All ovens are tested at the factory for functional operation. Operation is verified and adjustments are made to ensure proper function. However, field conditions are sometimes different than factory conditions. **It is necessary to have an authorized service technician verify operation and make field adjustments if needed.**

The Oven Initial Start-Up Checklist, found at the end of this manual, must be completed (both sides) at time of installation, signed by the Customer and returned to XLT Ovens and the Authorized Distributor to initiate Warranty Policy. **If the Start-Up Checklist is not filled out completely and returned to XLT Ovens, then the Warranty will not be honored.**

Start-up Procedure

1. Ensure that all ovens have been installed in accordance with the I&O Manual and that all utilities are connected to the ovens in compliance with local building codes.
2. Fill out Step 1 on the checklist with all information and print legibly.
3. Place all control boxes in service position. Start each oven and complete form.
4. Complete Start-up checklist with owner signature and return to XLT.

This oven is not capable of being safely placed in operation in the event of a power failure. No attempt should be made to operate this oven during power failure.

2. Conveyor - Green (Illuminated when conveyors are active and will flash if a problem is detected.)
3. Heat - Green (Illuminated when the oven is calling for heat and will remain lit while climbing to temperature. The LED will blink on and off when the oven reaches set point and will flash if a problem is detected.)
4. Main Fan - Green (Illuminated when fan is spinning and will flash if a problem is detected.)
5. Cool Down - Green (Illuminated when oven is in cool down mode.)
6. Alarm - Red (Illuminated when an alarm is tripped and some failure conditions will cause a flash.)

Split Belt Conveyor Time Control

Your XLT oven is constructed of stainless steel. Most commercial cleaning agents may be used safely on all stainless steel surfaces. Check application restrictions on product label prior to usage. Observe recommended precautionary and safety measures as dictated by the product manufacturer. Do not use caustic cleaner on the conveyor bearings.

Do not use abrasive cleaners or abrasive pads as they can scratch stainless steel surfaces. Areas with heavy buildup should be sprayed and allowed to soak for up to 5 minutes prior to wiping clean. Always wipe with the “grain” of the surface to maintain appearance.

Do not use caustic cleaners on the control panel and/or electronic components. Only use cleaners compatible with Lexan® on the face of the conveyor control.

The most critical items to be cleaned are the filters on the cooling fans. The filters are held in place by the stainless steel fan guard/filter mounts and can be washed several times. Regular cleaning of the cooling filters is important to maintain air circulation within the control box. Depending upon store conditions, the filters should be cleaned weekly or as they get clogged with dust. Please contact XLT Ovens for replacement parts.

Cooling Filter Maintenance

1. When cooling filters need to be cleaned a alarm will appear on the LUI saying “FILTER”.
2. Press the MENU button to enter the “FILTER RESET” screen.
3. Once the filter is cleaned, press ENTER to reset the filter timer. This will take you to another screen which will show you the timer back at 00:00 and will exit after 5 seconds.
4. If you wish to bypass alarm press the MENU button and it will clear the alarm for an additional 2 hours. Then the “FILTER” alarm will appear again.

Oven must be cool and all power to the oven and hood turned off before any cleaning or maintenance is done.

If the oven is to be removed from its installed location for cleaning or servicing, the following procedure is to be followed:

1. Shut off main electrical disconnect.
2. Unplug electric cord, if equipped.
3. Unlock casters.
4. Disconnect restraint.
5. When servicing or cleaning is complete, move oven to original location.
6. Connect restraint.
7. Lock casters.
8. Plug in electric cord, if equipped.
9. Turn on main electrical disconnect.
10. Follow normal starting instructions.

TIP

Read and understand the next 11 steps first. They illustrate how to remove components from the oven for cleaning.

Opening the Sandwich Door will provide a grip location for removing the Front Panel.

TIP**CAUTION**

Front Panels can weigh up to 75 lbs. [34 kg]. Use caution when lifting.

**CAUTION**

DO NOT spray liquid cleaning agents in the slots and holes in the following locations:

- Rear of Control Box
- Underneath Control Box
- Main Fan Motor Cover

As with any appliance, periodic maintenance is required. Many factors affect this schedule such as product mix and hours of usage. An example schedule is included.

Contact a factory representative or a local service company to perform all other maintenance and repairs.

DANGER

Oven must be cool and all power to the oven and hood turned off before any cleaning is done.

Proper Cooking

Experimentation is about the only way to determine proper time and temperature settings. While a pizza may look perfectly cooked on the outside, the inside may be undercooked. A thermometer is necessary to determine if food items are being properly cooked. Most health departments have rules and regulations that establish minimum temperatures for internal food temperatures. Most operators want to cook foods as fast as possible in order to serve more customers per hour. However, cooking foods slower is the only way to achieve a proper internal temperature. If your food products look acceptable on the outside, but have an internal temperature that is too low, then lowering the temperature and decreasing the belt speed (thereby increasing the cook time), will be necessary.

Several factors may affect the cooking performance and characteristics:

- Oven temperature (generally affects color)
- Conveyor speed (generally affects doneness)
- Finger arrangement
- Altitude
- Pans versus screens
- Dough thickness
- Cheese type
- Raw ingredient temperature (frozen?)
- Quantity of toppings

XLT ovens can be configured to cook a wide variety of food items. This is accomplished by arranging the fingers to control the baking characteristics. Generally speaking, most cooking is a “bottom up” process. The hot air from the bottom row of fingers has to go through the conveyor (a distance of about 2” / 50.8mm), heat the pan or screen, and then actually cook raw dough. The hot air from the top, on the other hand, basically only has to melt cheese and re-heat precooked toppings. Consequently, most operators will use the oven with the fingers arranged so that a lot more air is directed to the bottom of the pizza than to the top. There are places for an equal number of fingers above and below the conveyor. Available are finger cover plates that have six rows of holes, four rows of holes, two rows of holes, and no holes (or blank cover plates). A typical finger arrangement might have most or even all fingers on the bottom “full open”, that is fingers with all six rows of holes, and only two or three fingers on top with four or six rows of holes. The top fingers can be arranged in a symmetrical pattern or can be shifted asymmetrically to either the entrance or exit end of the conveyor. We encourage you to experiment by trying different finger arrangements, temperatures and belt speeds. XLT Ovens can assist you with your oven/product configurations.

Mechanical Function

If your oven does not function properly, please verify the following conditions:

1. Verify that the power cord to the oven is connected and the disconnect is in the “on” position.
2. Check to see that the circuit breakers in the building electrical service panel have not been tripped or turned off.
3. Check all circuit breakers on the oven control panel to ensure they have not been tripped.
4. Ensure proper voltage, amperage, and wire size.

If your oven still does not function properly, XLT has qualified customer service personnel that can provide assistance on any type of XLT oven problem you may experience. Customer Service is available 24/7/365 at 888-443-2751, or visit www.xltovens.com.

**DANGER**

Check all local codes prior to installation. Special requirements may be necessary depending upon building material construction. It is the installing contractor's responsibility to ensure that the structure the hood is to be hung from meets all codes and can carry the hood weight.

Purchaser's Responsibility

It is the responsibility of the purchaser:

- Thoroughly review the floor plans and specifications. The exact location of the oven must be determined before installing the hood.
- To unload, uncrate, assemble, and install the hood to its intended location.
- To ensure that electric utilities are installed on site in accordance with local building codes and with the specifications in this manual.
- To see that electric utilities are connected properly by a qualified installer using the proper hardware.
- To ensure a qualified installer has performed an initial start-up procedure.
- Location should minimize long and twisted duct runs. Make efforts to have a straight clear path to the roof fan curb.
- All hood supporting structures must be strong enough to support the weight of the hood and shrouds. Refer to the Hood Dimensions & Weights page for weight.
- Maintain the proper clearances from combustible materials according to International Mechanical code (IMC), and National Fire Protection Agency (NFPA) 96, and local mechanical codes.
- To Ensure that the AVI Hood is suspended properly from the ceiling structure.

The AVI Hood System consists of three (3) major parts; the Main Canopy, the Shrouds, and the Variable Frequency Drive (VFD) exhaust fan controller.

The Main Canopy serves to collect and transmit heat to the exhaust fan. It houses filters, lights, and switches. The switches control both the hood and ovens. The main canopy size is dependent upon oven size.

The Shrouds assist the efficiency of the main canopy by entrapping heat. They are configurable for either side or end loading or unloading, and are easily removable for cleaning and maintenance.

The VFD converts input power to variable frequency three-phase output power to control the speed of the exhaust fan. All electric utilities for the hood and exhaust fan connect through the electrical box located on the front of main canopy. The capacitive touch buttons are located on the Hood User Interface on the front of main canopy, and interlock the function of the hood and oven(s). There are relays that provide interlocks for equipment such as, HVAC dampers, and/or dedicated MUA units and there is an optional relay for fire suppression.

All AVI hoods are available pre-piped for fire suppression, allowing for simple, in-field installations. For fire suppression detailed information see manual XD-9011 Fire Suppression Installation for AVI Hoods and XLT Ovens.

The AVI hood was designed to conform to the requirements of IMC 2009, which is a Type I hood. It was also designed to have optional fire suppression added to meet requirements of NFPA 96 standard. This was done to allow XLT to better service the requirements of the customer and the associated jurisdictions.

**NOTE**

All values are CFM [M3/Min] unless otherwise noted. Figures represent TOTAL VOLUME measured at the duct.

In accordance with mechanical codes, make up air must be supplied. For commercial kitchen make up air, the amount is determined by the exhaust hood flow rate requirements & all other exhaust flow rate requirements in the kitchen.

At a minimum, smoke candles must be used for a Capture & Containment (C&C) test. Refer to the Ventilation Requirements disclosed in the Oven section in this manual.

A Test & Balance (TAB) report is recommended after installation has been completed. Below are the minimum items to be included in this report:

- Total airflow on all A/C, Make-Up Air (MUA), & exhaust systems.
- Airflow on each supply & exhaust grille.
- Airflows on exhaust hoods compared to design specifications.

A final air balance report, with any corrections of issues found in the report, will help to insure that your building systems are functioning properly & efficiently.

NOTE All values are FPM [M/Min] unless otherwise noted. Figures represent VELOCITY measured at the Grease Filter.

NOTE Most building codes require 500 Feet per Minute velocity. Exhaust duct is 1 ft². Check with your local building official for requirements.

The VELOCITY readings above are obtained by holding an anemometer 3” away from the Grease Filter. Take several readings in different locations across the filters and average the results.

CAUTION

Do not connect to 3 Phase power. 1 Phase Only.

Outputs from Electrical

The AVI Hood system provides:

- Up to (3) switching outputs for HVAC damper and/or dedicated unit.
- One (1) 230 VAC, 10 Amp, variable frequency, three phase power output for the ventilation exhaust fan.
- Relocation cord will physically connect into oven.

All structural members, electrical & fire suppression equipment shown for reference only.

Lifting Gear Setup

AVI hoods can easily be moved and stacked with the proper lifting equipment. The use of XLT approved lifting equipment is highly recommended. Contact XLT for more information.

Lifting Jack Setup

**DANGER**

- Check for smooth operation. The cable should not be pinched & should pass smoothly over the pulley on top of the pole assembly.
- Inspect cable prior to each use.
- If cable is frayed or shows signs of excessive wear & tear, DO NOT USE until cable is replaced.
- At a minimum replace the cable annually with wire rope that meets or exceeds the jack manufacturer's specifications.
- Do not exceed the stated capacity of the jack.

Stacking Hood on the Ovens

DANGER

Failure to engage the Lifting Jacks into the Lifting Pipe properly and completely will result in damage, injury, or death from a falling hood.

DANGER

- Both jacks should be raised in unison, otherwise they may bind and a dangerous situation will develop.
- Do not put any part of yourself under the hood at any time.
- The hood is top heavy. Be careful.

Hang Hood From Ceiling Joists

**DANGER****Hood Must Be Suspended From Ceiling Joists****NOTE**

This measurement is from the finished floor to the bottom of the suspended hood.

Install Hood Relocation Cord Assembly

All hoods are outfitted with three (3) switch relocation receptacles, regardless of how many XLT Ovens are installed. For a single oven use “Top” location. For a double stack use “Top” location for upper oven and “Bottom” location for lower oven, leaving “Middle” location open.

Insert and lock each oven control cord into the designated location on the bottom of the hood control box.

Connect Hood Relocation Cord Assembly

Variable Frequency Drive Adjustments

All AVI Hoods are functionally tested at the factory. Operation is verified, and adjustments are made to ensure proper operation. However, field conditions are sometimes different than factory conditions. These variables make it necessary to have an authorized service technician verify operation and make field adjustments if needed. The following items must be checked and verified to meet the specifications and requirements stated in this manual prior to the hood being commissioned:

- **Correct fan rotation**
- **Balanced make-up air**

The Initial Start-Up Checklist must be completed at time of installation, signed by the Customer and returned to XLT Ovens to initiate Warranty Policy.

The VFD controller is adjusted at the factory to the values displayed in the chart below.

If you require either more or less air flow, follow these steps:

1. Press & hold the <HOOD LIGHT> and <XLT LOGO> buttons to enter into factory tech mode.
2. Use the Up/Down arrows to reach manual air balance.
3. Press and hold <ENTER> button for 3 seconds. Entire row will flash.
4. Scroll to desired oven setting. Press <ENTER>.
5. +/- should flash and it allows +/- change upto 10 Hz.
6. Press <ENTER> to save changes.
7. Press <ON> to test air balance.

Initial Start Up

NOTE When XLT Ovens are outfitted with a XLT Hood and the receptacles unplugged from the wall and plugged into the hood., the main switch on the oven is disabled and no longer operates. The Hood User Interface (HUI) on the XLT Hood overrides the oven switch.

Hood Operation

1. Turn the desired oven(s) on by pressing the corresponding oven button. Refer to the Oven start-up section for instructions on how to adjust temperature and conveyor speed. The oven(s), exhaust fan, and make-up air unit will be activated by this switch if the XLT Hood is installed according to this manual.
2. Turn on the lights by pressing the hood lights button on the HUI. (Bulbs not included with hood)
3. When additional ovens are turned on, via the HUI the VFD will automatically increase the exhaust fan speed.
4. When shutting down the ovens, turn the desired oven off by pressing the corresponding button on the HUI. The make-up air unit will shut off. The exhaust fan will shut off after about 15 minutes and the oven will shut off after about 30 minutes.

Resetting Hood Cooling Fan and Grease Timer

1. The Cooling Fan and Grease Filter reset alarm will show up in the lower left hand side of the Hood User Interface. Press the Error Information button to enter reset screen.
2. To reset the Cooling Fan or Grease Filter press the center capacitive touch button with reset above it to set the time back to zero.
3. The following screen will show for 5 seconds and then return to the normal operating screen.

Factory Tech Mode

1. To enter Factory Tech Mode press and hold 2 buttons <HOOD LIGHT> and <XLT LOGO> for 10 sec. to enter.
2. Displays will show message for 3 sec. and beep, auto-advance.

Common or Per oven. Default common. Common MUA is on with any oven and has 1 speed setting. Per Oven MUA on per oven with up to 3 speed settings. ENTER to highlight values, arrows to change, ENTER to accept and advance.

Prove Air Flow

NO or YES. Default NO. CE and Australia require proving before oven ON. ENTER to highlight value, arrows to change, ENTER to accept and advance.

Manual Makeup Air

Common, 1, 2, or 3. This function can turn all ON or run individuals. ENTER to highlight value, ON to select units. Arrows to change, ENTER to accept and advance.

Manual VFD

This function can run VFD at 5Hz steps from 0-65Hz. ENTER to highlight value, use Up/Down arrows to increase and decrease value. ON to activate at selected speed. ENTER to accept and advance.

Air Balance

User to press ENTER to edit the +/- value. Default of 0Hz for the +/- value. Once the +/- value is in Edit Mode (flashing), press and hold ENTER for 3seconds. This allows user to select other lines (the entire line flashes at this point). Up/down arrows to scroll table to get to desired line. Press ENTER again to accept that line and make active. Press ON to turn fan on to setting (icon changes to OFF so user knows to press again to turn it OFF). Use +/- to change Hz for that setting until desired value shown. The Maximum ACT setting is 65Hz. Off when done with that value. Repeat with other settings as needed. Once all done, ENTER to accept and exit.

This is only portion of the VFD table that fits in display. 4 lines available, 2 are the titles, 2 are table values. Scroll Up/Down to see more of the table.

The valance kit size is determined by AVI Hood size & distance from the finished floor to the installed drop ceiling height. The valance kit screws directly to the AVI Hood & does not require any structural support. All kits have provisions for hood fire suppression piping to pass through without modification. The plastic coating must be removed from all parts prior to installation.

AVI Hood valance kits are available for different floor to ceiling heights. Contact XLT Ovens or your designated representative for more information.

Your AVI hood is constructed of stainless and aluminized steel. Check application restrictions on product label prior to usage. Observe recommended precautionary and safety measures as dictated by the product manufacturer.

Do not use abrasive or caustic cleaners. Abrasive pads will scratch stainless steel surfaces. Areas with heavy buildup should be sprayed and allowed to soak for up to 5 minutes prior to wiping clean. Always wipe with the “grain” of the surface to maintain appearance.
